PROJECT SKYLAB — SECOND SPACEWALK REPAIR
August 6th, 1973 - 1:32 P. M. - In a second 6 hour and 31 minute spacewalk - Astronauts Garriott and Lousma - successfully installed a new sunshade "sail" over the orbiting workshop. The new sail, the same size as the parasol, but shaped like a triangle, is attached to two 55-foot long poles built in five-foot sections. They later checked a radiator for leaking coolant but no leak was found. In other trouble-shooting assignments, they looked for wires which Mission Control thought might have been burned last week by a short circuit, and inspected the steering rockets which were leaking. Nothing unusual was found.
