### Lunar Module

After an epic space-voyage of over 240,000 miles, the Lunar Module is separated from the Command Service Module and goes into orbit 245 yards behind the CSM. Then it manoeuvres into a ten-mile orbit above the moon, passing over each of the five plains. Because of the presence of "Mascons," which are gravital pulls of dense areas, the Lunar Module "wobbles" during this orbit, before landing the first man on the moon
